

*John B. Hall, M.D., M.P.H., Director  
Cook County Department of Public Health*

THIS IS THE  
**CCDPH**

It is a combination of services and programs designed to prevent disease, prolong life, and improve the health of the public. It is a human operation that touches directly on the lives of people.

Its services include infant care, maternal, child and adult health, nursing, dental health, nutrition, communicable disease control, education and information, home health care and environmental health.

It serves over 2,000,000 people in an area of 735 square miles, including some 130 municipalities; a booming complex of cities, towns, villages, unincorporated communities and more or less isolated homes.

Its operations are paid for largely by taxes, not earmarked for public health, supplemented by a grant from state-federal funds and fees for service (Medicare payment for nursing services; restaurant, motel and trailer park licensure; and birth and death certificates).

Its personnel are a unique combination of

community health specialists who perform as a team to integrate their knowledge and skills for a broader understanding of human health problems . . . physicians, dentists, nurses, sanitary engineers, sanitarians, environmental health inspectors, nutritionists, physical therapists, public health educators, vision and hearing screening technicians and clerical staff.

It is one of the only active health service agencies that cross township and community boundaries, and is a vehicle through which comprehensive health planning can be achieved.

Its efforts to fulfill its obligations involve the Department in a continuing series of relationships with almost all of the groups, institutions and agencies which make up Cook County.

It is, finally, a Department striving to provide a high quality of public health service to an ever expanding population whose ever changing needs and increased demands for health service are a constant challenge.

## HOME HEALTH CARE

Skilled nursing care and rehabilitative services are provided to patients who no longer require hospitalization and can be adequately cared for at home. This service is provided under the supervision of the patient's physician.

There were close to a 1,000 fewer visits for home care services to Medicare patients in 1977. This was due to an increase in the number of Home Health Care Agencies that receive reimbursement for services. Twelve new agencies were certified for Medicare services in suburban Cook County. Home health care services to Public Aid and non-Medicare clients increased during 1977.

A new dimension has been added to the Home Health Care program by the employment of two Home Health Aids who work under the supervision of the nurse. They assist the patient by carrying out non-nursing activities. They provide light housekeeping services, assist in the preparation of special diets, help the patient learn to move from bed to chair and walk about, help the patient maintain good personal hygiene, observe and report to the nurse changes in the mental and physical condition of the patient.

### WELL CHILD CLINICS

Well Child Clinics are developed in cooperation with local communities. The 15 monthly clinics can be found in church basements, community centers, park districts, and city halls throughout the county.

Health supervision is provided for well children from birth to school entrance whose parents have a limited income. Physical examinations and immunizations are given by a physician or pediatric nurse practitioner. Through counseling the public health nurse guides the mother who has concerns about growth and development, behavioral problems and parenting. Special emphasis is given to nutrition. Each parent has an opportunity to discuss feeding problems with the nutritionist.

A physical assessment clinic for the WIC (Women, Infants and Children) program is conducted in the CCDPH, South District Office, monthly. This service is provided in cooperation with CEDA, the agency that administers the WIC program in suburban Cook County.

### MATERNAL CLINICS

The Maternal Clinic services in suburban Cook County are limited, however, the need for medical care for the expectant mother is recognized. The Department's underdeveloped prenatal clinic service is largely due to the difficulty in obtaining local hospital support for treatment of the expectant mother in case of an emergency, and for delivery of the baby.

The Maternal Clinics are held twice monthly in the South area. Medical supervision during pregnancy is provided. This includes periodic physical examinations, nutrition instruction as well as assistance in planning for the delivery and care of the newborn infant. The clinic at Worth is operated by the CCDPH, and the one at St. James Hospital is a cooperative service with the hospital and other community agencies.

### FAMILY PLANNING CLINICS

The CCDPH conducts three Family Planning Clinics and assists with the CEDA clinic in Harvey. Through individual teaching and group discussion, information is given on the advantages and disadvantages of each contraceptive method. This process helps a woman to make an informed decision about the method of birth control best suited to meet her needs.

Each client is given a complete physical examination by a gynecologist which includes a pelvic and breast examination, and screening for cervical cancer, anemia, venereal disease and high blood pressure. The physician, in prescribing a method of birth control, takes into consideration the needs and personal health of the woman.

A new Family Planning Service for Teens was established in Worth at the Township Hall. This component was added to the existing Maternal Clinic for the purpose of serving sexually active teenagers. As of October 1, 1977, the health educator began functioning as a part of the Family Planning Clinic team.

### SCHOOL HEALTH SERVICES

School health programs are a cooperative effort of the school administration and the CCDPH. Public health nurses, vision and hearing technicians, health educators, nutritionists and sanitarians provide services to both parochial and public schools. The CCDPH provides nursing service to parochial and private schools. The nurse functions as a consultant and coordinator of school health programs. Most public schools provide their own nursing service.

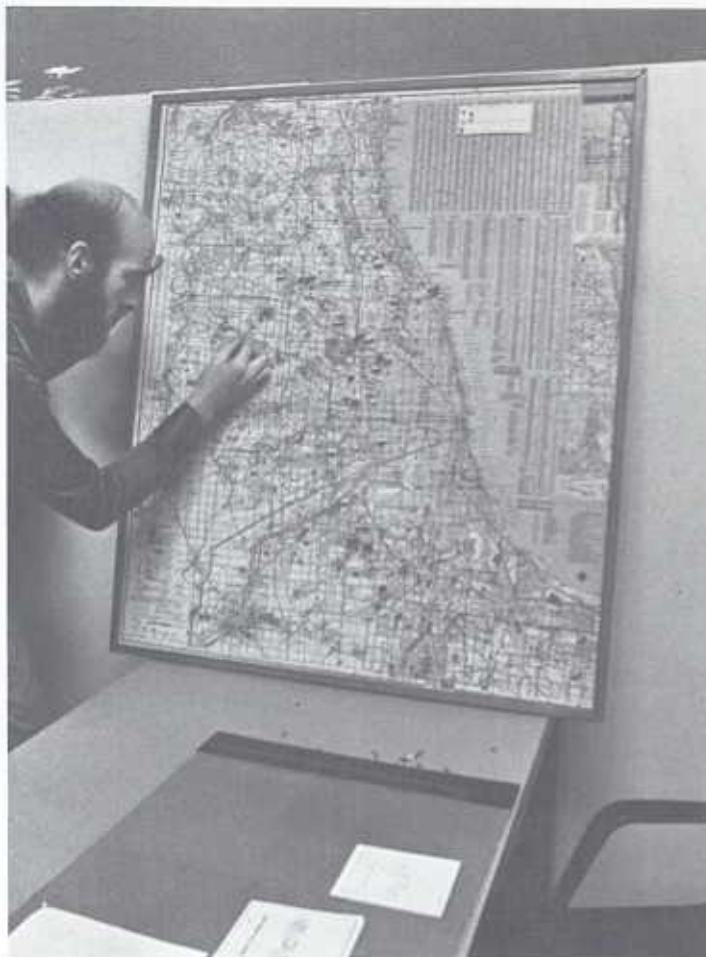

Schools and the CCDPH plan together to meet health needs of children. Programs recently developed include coordination of services for the pregnant teenager, physical examinations for medically indigent children, assistance in curriculum development, consultation on immunizations and communicable disease control, and dental screening.

Vision and hearing screening for parochial and private school children is done by the CCDPH. Children who fail the hearing test and are not under the care of a private physician are referred to the Otologic Clinic for further evaluation and recommended follow-up.

### RHEUMATIC FEVER PROGRAM

A register of all rheumatic fever patients receiving prophylactic medication is maintained by the CCDPH. A patient registered by a physician receives free drugs to prevent recurring attacks of rheumatic fever. Re-examination by a physician is required once a year, and renewal of orders every three months.

## IMMUNIZATION

The measles epidemic that began in the later months of 1976 continued into 1977. In addition to the 12 monthly on-going Immunization Clinics, seven special measles clinics were held in January and February. Over 14,000 immunizations were given at these special clinics.

Guidelines were developed to aid local communities in establishing immunization clinics under the supervision of the CCDPH. As a result of this effort four community sponsored clinics have opened.

The CCDPH worked closely with the Education Service Region of Cook County in the surveillance of school health records to make sure that each school-age child is adequately protected against preventable communicable diseases. In an effort to make immunization clinics more accessible, plans were initiated for opening four evening clinics.

An active program of surveillance on the incidence of influenza was developed with selected hospitals and schools. An epidemiological study is done on all reported cases of enteric diseases, such as salmonellosis and shigellosis, in order to break the chain of infection.

## TUBERCULOSIS CONTROL

Over the past several years, there has been a decrease in the incidence of tuberculosis in suburban Cook County. There has also been a shift in reported cases to the older age group and to persons who have recently migrated to the United States from foreign countries with a high tuberculosis incidence.

The tuberculosis control program is maintained through the cooperative efforts of private physicians, out-patient clinics, The Suburban Cook County Tuberculosis Sanitarium District, and the CCDPH. Adequate medical and nursing supervision of individuals and families, as well as family and community education are essential in a tuberculosis control program.

## LABORATORY SERVICES

As the CCDPH does not maintain a laboratory, these services are provided by the Illinois Department of Public Health. Through the CCDPH medical consultation is available to physicians regarding specific laboratory tests and their interpretation. Copies of all laboratory reports are reviewed and investigations made as indicated.

## SEXUALLY TRANSMISSIBLE DISEASE CONTROL

The STD Control Division of the CCDPH operates and maintains free, confidential VD clinics throughout suburban Cook County. These clinics provide testing and treatment for all sexually transmissible diseases: genital herpes, venereal warts, non-specific urethritis, vaginitis, scabies, lice, and crabs, as well as gonorrhea and syphilis. These services are available free-of-charge to all persons twelve years of age and older without parental consent. All clinic records are confidential as required by Illinois law. Clinic attendance for 1977 increased 12 percent.

The most common complication of gonorrhea is pelvic inflammatory disease (PID). In Cook County, physicians in emer-

gency rooms are encouraged to maintain a high index of suspicion when examining female patients with pelvic complaints. To assist providers in managing these patients, the CCDPH offers a complete PID referral program to help prevent recurrent episodes. Epidemiologic services are available on physician's request, along with diagnostic support, medications and retesting.

Physicians practicing in areas where there is a high incidence of gonorrhea are provided with all the materials and services necessary for obtaining a culture for gonorrhea as a part of the pelvic examination. These materials and services include: culture media, laboratory service, transport service, medication and epidemiologic follow-up upon request. There is no charge to physicians for these services.

### DENTAL HEALTH

The CCDPH conducts 14 Dental Clinics in the suburbs which are cooperatively sponsored by local schools and community groups. The three dentists on the staff provide treatment to children ages 5 to 16 whose families are unable to secure these services, or who for other reasons would not get dental care. Patients requiring specialized treatment are referred to appropriate facilities.

Screening programs are conducted in selected areas to identify school-age children in need of dental care.

Health education has high priority in the program. CCDPH works with school administrators, nurses, community groups and professionals to create an awareness of dental problems, and to promote prevention of tooth decay and dental disease.

Dental research shows that children rinsing weekly with a fluoride mouth rinse preparation can reduce tooth decay by 20 percent. Mouth rinse programs are being introduced in public and parochial schools.

### NUTRITION

Much distorted or false nutrition-related information reaches the public through the mass media. Therefore, there is an ever increasing need for accurate information from professionally trained people.

The methods used in carrying out nutrition education are focused on greater participation in Well Child and Maternal Clinics and home visits to families requiring special assistance. Increased cooperative activities to meet the requests for nutrition services extend to nursing homes, community groups and young health professionals.

Helping people learn a better way to eat to insure adequate nutrition is the major role of the Nutrition Division. The individuals who seek this information may include a young mother with an infant, a wife who is caring for a sick husband, a teacher concerned about inattentive pupils, a housewife with a freezer full of defrosted food, or a co-worker who needs ideas to encourage a thin child to eat.

## HEALTH EDUCATION

Health education is provided to the consumer in a variety of settings and is offered on both an individual and group basis. Efforts are directed at developing community support for the utilization of Health Department services.

In April, 1977 a workshop entitled "Crisis of the Pregnant Teenager" was held in cooperation with the Education Service Region of Cook County. The objectives of the conference were to create an awareness of the problem and to encourage schools and community agencies to work together in developing coordinated programs for pregnant teenagers and school-age parents.

To assist the consumer, a clearinghouse for health information is maintained. A Pamphlet Resource Guide was developed and distributed to school and community libraries and to health professionals. It is intended as an aid in securing health pamphlets.

## COMMUNITY ORGANIZATION

The most effective public health work is carried on in communities where there is interest and active participation by the consumer in planning and organizing health programs. During the past year community and citizen interest in public health was

aroused through the efforts of community newspapers, civic-minded citizens and organized groups. Requests were received to assist communities in studying and planning for more adequate health services. In order that public health moves in a coordinated and purposeful direction, increased emphasis is placed on involving the consumer in health planning.

## PROFESSIONAL EDUCATION

An increasing number of requests to provide field experience for students are being received by the Department from Schools of Public Health, Medical and Nursing Schools, Hospitals and Universities.

Field experience provides the student with an opportunity to implement the concepts and theory of Public Health, and to further develop skills and knowledge. This training is provided under the guidance of both faculty and agency professionals. Students include physicians, nurses, nutritionists, health educators and dietetic interns. Student guidance is a stimulating experience for the staff and serves as a recruiting method for personnel.

## ENVIRONMENTAL HEALTH

Environmental health programs designed to protect the public health range from recreational to water supply and sewage disposal, and are primarily done in the unincorporated areas. In those communities that do not employ an inspectional staff, these services are provided by the CCDPH at the request of the village officials.

The Food Manager Certification program has been delayed by a change in the State Rules and Regulations until January 1, 1980. However, the CCDPH is urging food managers to obtain their certification prior to the deadline. As long as there are requests, classes will be made available to all food managers as an aid in becoming certified.

### INSPECTIONS:

- Swimming pools (private, public, indoor, outdoor)
- Water treatment plants
- Food handling establishments
- Hospitals
- Nursing homes
- Schools (on request)
- Solid waste disposal sites
- Sewage treatment plants
- Recreational areas

### INVESTIGATIONS:

- Nuisance complaints (uninc.)
- FHA evaluations
- Stream pollution
- Water samples
- Private water sample analysis
- Insect and rodent control
- Youth camps

### LICENSING:

- Mobile home parks
- Septic tank cleaners
- Motels (uninc.)
- Food service establishments (uninc.)

### APPROVAL OF CONSTRUCTION APPLICATIONS:

- Septic tanks and seepage system applications
- Subdivisions (uninc.)
- Swimming pools
- Private water supply (uninc.)

## VITAL RECORDS

Births and deaths occurring in most of suburban Cook County are registered by CCDPH. Just as records of births are essential to planning for schools, hospitals, and other community services, current information about births and deaths are important in planning public health services and facilities.

Certified copies of birth and death records can be obtained upon request for a fee of three dollars a copy. These fees are turned over to the County Treasurer.

Certified copies are requested for many different purposes. A certified record of birth is needed, for example, when a child begins school or when, as a teenager, he applies for his first job. Certified copies of death records are often required in the settlement of an estate or in the collection of insurance benefits

by one's survivors.

Since the certificates of births and deaths become permanent legal records, the health department is in constant touch with many physicians, hospitals, and funeral directors to insure that the records are accurate in every detail. Copies of all vital records are made for the files of the health department as well as the County Clerk.

Of particular significance is the information gleaned from a review of birth and death certificates. Medical and nursing follow-up is indicated when the birth certificate reveals a single or teenage parent, premature birth, home delivery, complications of pregnancy and birth abnormality. When the cause of death is due to a communicable disease more detailed facts are obtained.
