Chlamydia

What is it/what causes it?

Chlamydial infections are caused by the bacterium *Chlamydia trachomatis*. *C. trachomatis* infections are easily cured with appropriate antibiotics. Though chlamydial infections are the most commonly reported communicable disease in Cook County Department of Public Health's (CCDPH) jurisdiction as well as the United States overall, underreporting is a significant problem because most individuals with chlamydial infections are asymptomatic and do not seek testing.ⁱ

Why is it important?

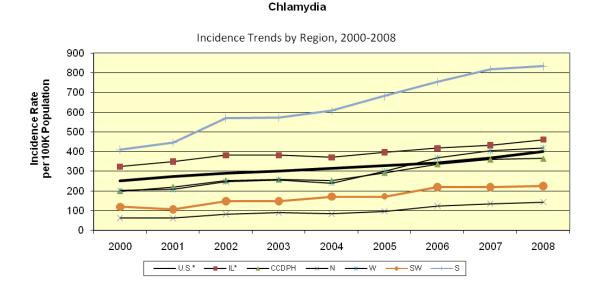

Because most people with chlamydial infections have no symptoms, many infections may go untreated. Untreated chlamydial infections, in turn, can lead to significant reproductive sequelae, including fallopian tube scarring and infertility in females and urethritis and epididymitis in males.ⁱ

2000-2008

Between 2000 – 2008, chlamydia rates increased for the U.S., Illinois, and all four districts within CCDPH's jurisdiction. Rates in the South district increased more sharply than rates in the other regions. In 2008, the rate in the South District was 833.1 per 100,000 population; the rate in the West district was 417.8 per 100,000 population.

Although rates have increased between 2000 - 2008, it is not clear whether these increases are a result of more new *C. trachomatis* infections or whether they reflect increases in the ease and availability of testing for *C. trachomatis* or some combination of these factors.

Figure 1

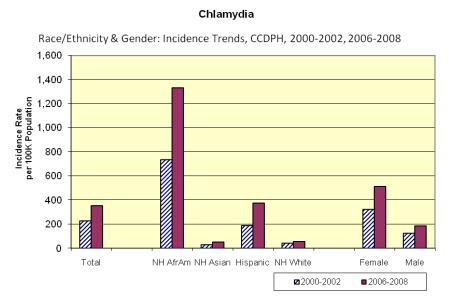

Cook County Department of Public Health

2000-2002 vs. 2006-2008 By Race and Gender

Chlamydia rates within CCDPH's jurisdiction increased from 224.4 per 100,000 population between 2000-2002 to 353.6 per 100,000 population between 2006-2008.

The overall chlamydia rate of 1,333.5 per 100,000 population in African Americans (2006-2008) was 3.6 times higher than the rate in Hispanics (375.1 per 100,000 population) and 25 times the rate in Whites and Asians (54.1 and 53.2 per 100,000 population, respectively).

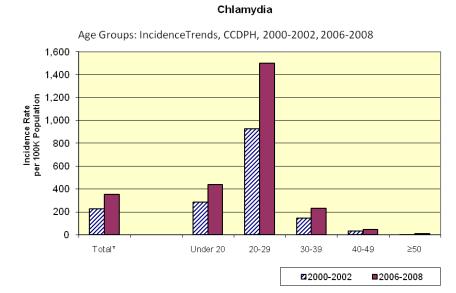

2000-2002 vs. 2006-2008 By Age Groups

In most age groups, chlamydia rates were higher between 2006-2008 than 2000-2002. In persons aged 15-19 years, the chlamydia rate increased 56% from 1,168.1 per 100,000 population during 2000-2002 to 1,825.9 per 100,000 population during 2006-2008.

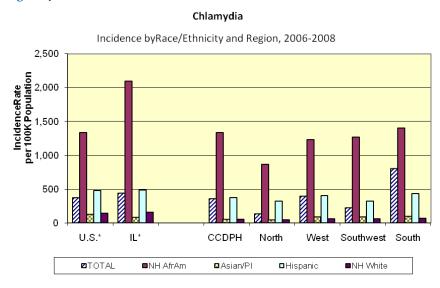

Between 2006-2008, the highest chlamydia rate was in persons aged 20-24 years (2,161.8 per 100,000 population), and the second highest rate was in persons 15-19 years of age (1,825.9 per 100,000 population).

Figure 3

2006-2008 By Race/Ethnicity and Region

For years 2006-2008, disparity in rates by race/ethnicity was similar in the U.S., Illinois and each CCDPH district. Chlamydia rates were highest in African Americans. In the CCDPH jurisdiction, rates in African Americans ranged from a low of 865.6 per 100,000 population in the North district to 1,403.6 per 100,000 population in the South district.

By Gender and Region

In CCDPH's jurisdiction during 2006-2008, the chlamydia rate in females was 511.8 per 100,000 population, 2.8 times higher than the rate in males (185.1 per 100,000 population).

Females in the South district had the highest chlamydia rate (1,134.3 per 100,000 population).
