

What is it?

Syphilis infections are caused by the bacterium *Treponema pallidum* and are classified in stages (primary, secondary, and latent). Syphilis is referred to as "the great imitator" because clinical manifestations can be easily mistaken for other medical conditions. Infections are transmitted through direct contact with chancres, or syphilis sores, which are present during the first two stages (primary and secondary syphilis).ⁱ

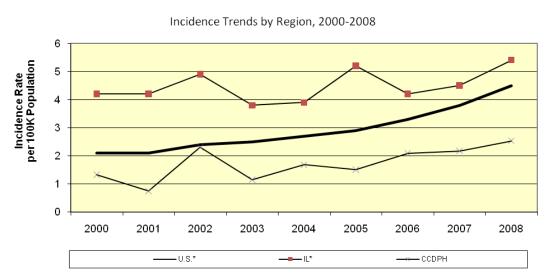

Why is it important?

Syphilis can spread from a pregnant woman to her baby if she does not receive treatment. Babies with syphilis may have birth defects or may be stillborn. Syphilis infections can also facilitate the transmission and acquisition of HIV. Persons are 2 to 5 times more likely to acquire HIV when syphilis is also present.ⁱⁱ In 2009, Cook County (including the City of Chicago) ranked second in the US in the number of primary and secondary syphilis cases behind Los Angeles.ⁱⁱⁱ

2000-2008

Though somewhat lower than rates in Illinois and the US, rates for Cook County Department of Public Health (CCDPH) primary and secondary (P & S) syphilis rose between 2000 and 2008. In the CCDPH jurisdiction, the 2008 rate of P & S syphilis was 2.5 per 100,000 population, 12.5 times the Healthy People (HP) 2010 goal of 0.2 per 100,000 population. Between 2005 and 2006, the rate of P & S syphilis in the CCDPH jurisdiction increased 40%, from 1.5 per 100,000 population to 2.1 per 100,000 population. Nationally, rates increased 18%, from 4.1 per 100,000 population in 2007 to 4.8 per 100,000 population in 2008.

Figure 1

Primary and Secondary Syphilis

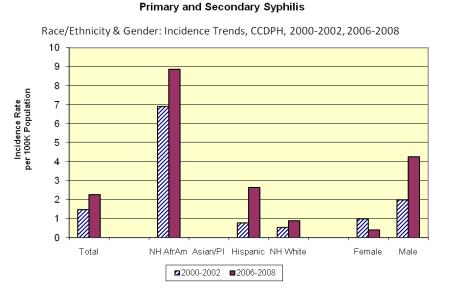

2000-2002 VS. 2006-2008 By Race/Ethnicity and Gender

P & S syphilis cases increased from a rate of 1.5 per 100,000 population between 2000-2002 to a rate of 2.3 per 100,000 population between 2006-2008.

African Americans in CCDPH had the highest rate of P & S syphilis between 2006-2008 (8.9 per 100,000 population), 45 times higher than the HP 2010 goal.

The P & S rate in males between 2006-2008 was 4.2 per 100,000 population, 10 times higher than the average rate in females over the same time (0.4 per 100,000 population).

Figure 2

2000-2002 VS. 2006-2008 By Age Groups

Among those aged 20-29 years, the P & S syphilis rate nearly doubled, from 3.9 per 100,000 population between 2000-2002 to 7.2 per 100,000 population between 2006-2008. Rates also increased in other age groups over the two time periods: in those aged 30-39 years, the rate increased 17% from 3.0 to 3.5 per 100,000 population. Among those aged 40-49 years, the P & S rate increased 50% from 2.4 per 100,000 population between 2000-20002 to 3.6 per 100,000 population between 2006-2008. Finally, in those aged 50 years and older, the rate increased 75% from 0.4 per 100,000 population between 2000-2002 to 0.7 per 100,000 population between 2006-2008.

Primary and Secondary Syphilis

2006-2008 By Race/Ethnicity and Region

P & S syphilis rates were higher in African Americans locally, statewide and nationally. In CCDPH's jurisdiction, the P & S syphilis rate in African Americans (2006-2008) ranged from a low of 5.4 per 100,000 population in the West district to a high of 10.9 per 100,000 population in the North district.

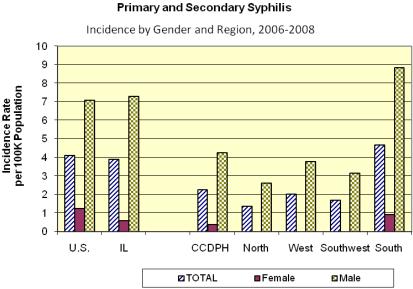

By Gender and Region

The P & S rate in the CCDPH jurisdiction between 2006-2008 was 2.3 per 100,000 population, below the overall rate in the U.S (4.1/100,000).

The P & S syphilis rate (2006-2008) in males was substantially higher than the rate in females locally, statewide and nationally. In the South district during 2006-2008, the rate among males was 8.8 per 100,000 population, nearly 10 times higher than the rate among females in the South (0.9 per 100,000 population).
