

*This report describes current trends in suburban Cook County for influenza and other respiratory viruses. Selected graphics are presented on pages 2-4. For complete surveillance data on flu, COVID-19, and RSV, please visit our dashboard at <https://ccdphcd.shinyapps.io/influenza/>. CCDPH is also now tracking “Broad Respiratory” illness in our hospitalization data. This CDC-defined syndrome includes a wide array of specific and non-specific respiratory diagnoses and complications, such as bronchitis or pneumonia.*

## Key Points

Overall, influenza activity is **Moderate**, and increasing.

- For the first time this season, the percent of ED visits with a flu diagnosis has surpassed the percent of ED visits with a COVID diagnosis. However, hospital admissions are higher for **COVID-19**.
- Influenza is increasing the fastest among children. The percent of ED visits for flu in this age group is four times higher than it was in early December. The percent of hospital admissions for flu in school-aged children, in particular, has tripled in the last two weeks.
- The overall percent of hospital admissions for flu is approaching the peak of the prior season (2022-2023).
- ICU admissions for influenza doubled from the previous week. Flu-related ICU admission rates are the highest among children under five, adults over 65, and non-Hispanic Black residents.
- RSV remains elevated, especially in children under 5, but activity has likely peaked for the season.
- Of specimens tested for influenza, 14.0% are positive. 6.5% of RSV and 15.6% of COVID-19 specimens tested are positive.
- Of specimens positive for influenza, 90% have been influenza A. Forty-five influenza A specimens have sub-type available. Of these, 67% were pandemic 2009 H1N1 and 33% were H3N2.
- Wastewater detections for influenza A are rising.
- Recommendations for individuals include staying up-to-date with all [recommended respiratory vaccines](#). The CDC recommends everyone six months and older get both an annual flu shot (ideally by the end of October) and an updated 2023-2024 COVID-19 shot. New vaccines are also available for RSV this season. Talk to your health care provider about the RSV vaccine or RSV antibody shot if you have a child under 2, are over 60 years old, or are pregnant. Recommendations also include staying home when sick, avoiding contact with others who might be sick, and practicing good respiratory hygiene like washing your hands and covering your cough.
- Recommendations for communities and healthcare organizations include promoting equitable access to respiratory vaccines and tests, masks, medications, and support services. Support individuals to stay home when sick with respiratory symptoms or testing positive for COVID-19. Clinicians should review guidelines for [antiviral treatment](#) when respiratory pathogens are co-circulating and healthcare facilities may wish to consider additional [mitigation strategies](#) such as universal masking and visitor restrictions.
