

WEST NILE VIRUS SURVEILLANCE REPORT

Week 28: Jul 12-Jul 18, 2026

Cook County DEPT. of
Public Health

BUILDING
HEALTHIER
COMMUNITIES

Purpose: This report serves as the official statement of West Nile virus activity in humans, mosquitoes, and birds within the jurisdiction of the Cook County Department of Public Health. All data are preliminary and may change as more reports are received.

Risk Assessment: The risk of human West Nile virus infection is **increasing**.

Prevention: When outdoors between dusk and dawn, cover skin with lightly colored loose fitting clothing and use mosquito repellent with DEET, picaridin or oil of lemon eucalyptus. When applying repellent, always follow the directions on the product label. Get rid of standing water around your home in pet bowls, flower pots, old tires, baby pools and toys. Water that is allowed to stagnate for three or four days becomes a breeding ground for mosquitoes. Make sure your doors and windows have tightly fitting screens and repair any tears or other openings. Keep weeds and grass cut short and keep gutters clean and free of debris.

Mosquito¹⁻² Surveillance:

Weekly Summary	Week 28
Number of mosquitoes tested	26789
Number of mosquito pools tested	647
Number of positive pools	145
Percent of pools testing positive	22%
Number of communities with positive pools	50

Year to Date Summary	2026	3 Year Average
Number of mosquitoes tested	129071	157357
Number of mosquito pools tested	3700	4146
Number of positive pools	279	231
Percent of pools testing positive	8%	6%
Number of communities with positive pools	64	48

1. Includes mosquito surveillance data from Cook County Department of Public Health, Northwest Mosquito Abatement District, North Shore Mosquito Abatement District, Desplaines Valley Mosquito Abatement District, South Cook County Mosquito Abatement District, and the Illinois Department of Public Health.

2. When mosquitoes are tested for West Nile virus, they are tested in groups, or "pools", of up to 50 mosquitoes. Therefore when a mosquito pool tests positive, the number of WNV positive mosquitoes in that pool is unknown. It is only known that at least one mosquito in the pool was positive.

The following map shows mosquito traps in suburban Cook County. The estimated infection rate⁴ is a measurement of how much West Nile virus activity is occurring in mosquitoes caught by that trap. Higher numbers means more mosquitoes capable of spreading West Nile virus.

4. Estimated infection rate is calculated by dividing the number of positive mosquito pools by the total number of mosquitoes tested and multiplying by 1000. This is also called the minimum infection rate and is the most conservative estimate of West Nile virus activity in mosquitoes.

5. Reasons a trap might not be tested include battery or other equipment failure or no mosquitoes present in the trap.

Bird Surveillance:

Due to the ongoing H5 bird flu outbreak, the Illinois Department of Public Health has paused testing of dead birds for West Nile Virus.

Human Case Surveillance:

The traditional WNV surveillance period began on May 10 for the 2026 season. Since May 10, no cases of West Nile virus have been reported in suburban Cook County.
